(54) Title: FUEL COMPOSITIONS CONTAINING POLYALKYL AND POLY(OXYALKYLENE) AROMATIC ESTERS

(57) Abstract

A fuel additive having formula (I) wherein A₁ is a thioether, a sulfoxide, a sulfonance, a sulfonic acid, a sulfonamide, a nitrile, a carboxylic acid or ester, or a carboxylic acid or ester, or a carboxylic acid or lower alkoy, to lower alkyl or lower alkoxy, R₃ and R₄ are independently hydrogen or lower alkyl; n is an integer from 0 to 100; and when n is 0 to 10, R₅ is polyalkyl having an average molecular weight of 450 to 5,000; and when n is 5 to 100, R₅ is hydrogen, alkyl, phenyl, aralkyl, alkaryl or an acyl group having formula: (a)

acyl group having formula: (a)
or (II) wherein R₆ is alkyl, phenyl, aralkyl or alkaryl; R₇ and R₈ are independently hydrogen, hydroxy, lower alkyl or lower alkoxy; A₂ is a thioether, a sulfoxide, a sulfone, a sulfone acid, a sulfonamide, a nitrile, a carboxylic acid or ester, or a carboxamide; and x and y are independently integers from 0 to 10; with the proviso that when n and x are both 0, then A₁ may not be a carboxylic acid or ester, or a carboxamide.

10 11

12 .

This invention relates to polyalkyl and poly(oxyalkylene) aromatic esters and to fuel compositions containing poly(oxyalkylene) aromatic esters. More particularly, this invention relates to polyalkyl and poly(oxyalkylene) aromatic esters which are substituted on the aromatic moiety and to the use of such compounds in fuel compositions to prevent and control engine deposits.

BACKGROUND OF THE INVENTION

14 15

Description of the Related Art

16 17

It is well known that automobile engines tend to form . 18 deposits on the surface of engine components, such as 20 carburetor ports, throttle bodies, fuel injectors, intake 21 ports and intake valves, due to the oxidation and polymerization of hydrocarbon fuel. These deposits, even 23 when present in relatively minor amounts, often cause noticeable driveability problems, such as stalling and poor acceleration. Moreover, engine deposits can significantly increase an automobile's fuel consumption and production of 26 exhaust pollutants. Therefore, the development of effective 28 fuel detergents or "deposit control" additives to prevent or 29 control such deposits is of considerable importance and 30 numerous such materials are known in the art.

31

32

33

For example, aliphatic hydrocarbon-substituted phenols are known to reduce engine deposits when used in fuel compositions. U.S. Patent No. 3,849,085, issued

-2-

November 19, 1974 to Kreuz et al., discloses a motor fuel 01 02 composition comprising a mixture of hydrocarbons in the 03 gasoline boiling range containing about 0.01 to 0.25 volume 04 percent of a high molecular weight aliphatic 05 hydrocarbon-substituted phenol in which the aliphatic 06 hydrocarbon radical has an average molecular weight in the 07 range of about 500 to 3,500. This patent teaches that 80 gasoline compositions containing minor amounts of an 09 aliphatic hydrocarbon-substituted phenol not only prevent or 10 inhibit the formation of intake valve and port deposits in a 11 gasoline engine, but also enhance the performance of the 12 fuel composition in engines designed to operate at higher 13 operating temperatures with a minimum of decomposition and 14 deposit formation in the manifold of the engine. 15 16 Similarly, U.S. Patent No. 4,134,846, issued January 16, 17 1979 to Machleder et al., discloses a fuel additive 18 composition comprising a mixture of (1) the reaction product 19 of an aliphatic hydrocarbon-substituted phenol, 20 epichlorohydrin and a primary or secondary mono- or 21 polyamine, and (2) a polyalkylene phenol. This patent 22 teaches that such compositions show excellent carburetor, 23 induction system and combustion chamber detergency and, in 24 addition, provide effective rust inhibition when used in 25 hydrocarbon fuels at low concentrations. 26 27 Amino phenols are also known to function as 28 detergents/dispersants, antioxidants and anti-corrosion 29 agents when used in fuel compositions. U.S. Patent 30 No. 4,320,021, issued March 16, 1982 to R. M. Lange, for 31 example, discloses amino phenols having at least one 32 substantially saturated hydrocarbon-based substituent of at 33 least 30 carbon atoms. The amino phenols of this patent are 34 taught to impart useful and desirable properties to

-3-

oil-based lubricants and normally liquid fuels. Similar amino phenols are disclosed in related U.S. Patent No. 4,320,020, issued March 16, 1982 to R. M. Lange.

Similarly, U.S. Patent No. 3,149,933, issued September 22, 1964 to K. Ley et al., discloses hydrocarbon-substituted amino phenols as stabilizers for liquid fuels.

U.S. Patent No. 4,386,939, issued June 7, 1983 to R. M.
Lange, discloses nitrogen-containing compositions prepared
by reacting an amino phenol with at least one 3- or
4-membered ring heterocyclic compound in which the hetero
atom is a single oxygen, sulfur or nitrogen atom, such as
ethylene oxide. The nitrogen-containing compositions of
this patent are taught to be useful as additives for
lubricants and fuels.

Nitro phenols have also been employed as fuel additives. For example, U.S. Patent No. 4,347,148, issued August 31, 1982 to K. E. Davis, discloses nitro phenols containing at least one aliphatic substituent having at least about 40 carbon atoms. The nitro phenols of this patent are taught to be useful as detergents, dispersants, antioxidants and demulsifiers for lubricating oil and fuel compositions.

. 27

. 28

Similarly, U.S. Patent No. 3,434,814, issued March 25, 1969 to M. Dubeck et al., discloses a liquid hydrocarbon fuel composition containing a major quantity of a liquid hydrocarbon of the gasoline boiling range and a minor amount sufficient to reduce exhaust emissions and engine deposits of an aromatic nitro compound having an alkyl, aryl, aralkyl, alkanoyloxy, alkoxy, hydroxy or halogen substituent.

-4-

01 More recently, certain poly(oxyalkylene) esters have been 02 shown to reduce engine deposits when used in fuel 03 compositions. U.S. Patent No. 5,211,721, issued May 18, 04 1993 to R. L. Sung et al., for example, discloses an oil 05 soluble polyether additive comprising the reaction product 06 of a polyether polyol with an acid represented by the 07 formula RCOOH in which R is a hydrocarbyl radical having 6 80 to 27 carbon atoms. The poly(oxyalkylene) ester compounds 09 of this patent are taught to be useful for inhibiting 10 carbonaceous deposit formation, motor fuel hazing, and as 11 ORI inhibitors when employed as soluble additives in motor 12 fuel compositions. 13 14 Poly(oxyalkylene) esters of amino- and nitrobenzoic acids 15 are also known in the art. For example, U.S. Patent 16 No. 2,714,607, issued August 2, 1955 to M. Matter, discloses 17 polyethoxy esters of aminobenzoic acids, nitrobenzoic acids 18 and other isocyclic acids. These polyethoxy esters are 19 taught to have excellent pharmacological properties and to 20 be useful as anesthetics, spasmolytics, analeptics and 21 bacteriostatics. U.S. Patent Nos. 2,714,608; 2,714,609; and 22 2,714,610, all issued to M. Matter, disclose similar 23 polyethoxy esters. 24 25 Similarly, U.S. Patent No. 5,090,914, issued February 25, 26 1992 to D. T. Reardan et al., discloses poly(oxyalkylene) 27 aromatic compounds having an amino or hydrazinocarbonyl 28 substituent on the aromatic moiety and an ester, amide, 29 carbamate, urea or ether linking group between the aromatic 30 moiety and the poly(oxyalkylene) moiety. These compounds 31 are taught to be useful for modifying macromolecular species

such as proteins and enzymes. U.S. Patent Nos. 5,081,295;

5,103,039; and 5,157,099, all issued to D. T. Reardan

33 34

-5-

et al., disclose similar poly(oxyalkylene) aromaticcompounds.

03

06

07

80

09 :

10.

U.S. Patent No. 4,328,322, issued September 22, 1980 to R. C. Baron, discloses amino— and nitrobenzoate esters of oligomeric polyols, such as poly(ethylene) glycol. These materials are used in the production of synthetic polymers by reaction with a polyisocyanate. Similar materials are disclosed in U.S. Patent No. 4,515,981, issued May 7, 1985 to K. Otani et al., and in U.S. Patent Nos. 5,039,775 and 5,086,153, both issued to Y. Oyaizu.

11 12

> 13 In addition, U.S. Patent No. 4,231,759, issued November 4, 14 1980 to Udelhofen et al., discloses a fuel additive composition comprising the Mannich condensation product of 15 .16 (1) a high molecular weight alkyl-substituted .17. hydroxyaromatic compound wherein the alkyl group has a 18 number average molecular weight of about 600 to about 3,000, 19 (2) an amine, and (3) an aldehyde. This patent teaches that 20 such Mannich condensation products provide carburetor 21 cleanliness when employed alone, and intake valve 22 cleanliness when employed in combination with a hydrocarbon 23 carrier fluid.

24

25 U.S. Patent No. 4,859,210, issued August 22, 1989 to Franz 26 et al., discloses fuel compositions containing (1) one or 27 more polybutyl or polyisobutyl alcohols wherein the 28 polybutyl or polyisobutyl group has a number average molecular weight of 324 to 3,000, or (2) a poly(alkoxylate) 30 of the polybutyl or polyisobutyl alcohol, or (3) a 31 carboxylate ester of the polybutyl or polyisobutyl alcohol. 32 This patent further teaches that when the fuel composition 33 contains an ester of a polybutyl or polyisobutyl alcohol, .34 the ester-forming acid group may be derived from saturated

-6-

or unsaturated, aliphatic or aromatic, acyclic or cyclic mono- or polycarboxylic acids.

U.S. Patent No. 3,285,855, issued November 15, 1966 to Dexter et al., discloses alkyl esters of dialkyl hydroxybenzoic and hydroxyphenylalkanoic acids wherein the ester moiety contains from 6 to 30 carbon atoms. This patent teaches that such esters are useful for stabilizing polypropylene and other organic material normally subject to oxidative deterioration. Similar alkyl esters containing hindered dialkyl hydroxyphenyl groups are disclosed in U.S. Patent No. 5,196,565, which issued March 23, 1993 to Ross.

U.S. Patent No. 5,196,142, issued March 23, 1993 to Mollet et al., discloses alkyl esters of hydroxyphenyl carboxylic acids wherein the ester moiety may contain up to 23 carbon atoms. This patent teaches that such compounds are useful as antioxidants for stabilizing emulsion-polymerized polymers.

It has now been discovered that certain polyalkyl and poly(oxyalkylene) aromatic esters which are substituted on the aromatic moiety are surprisingly useful for reducing engine deposits, especially intake valve deposits, when employed as fuel additives in fuel compositions.

SUMMARY OF THE INVENTION

The present invention provides novel polyalkyl and poly(oxyalkylene) aromatic esters which are useful as fuel additives for the prevention and control of engine deposits, particularly intake valve deposits.

The polyalkyl and poly(oxyalkylene) aromatic esters of the present invention have the formula:

wherein A₁ is selected from the group consisting of SR^I, SOR^{II}, SO₂R^{III}, wherein R^I, R^{II} and R^{III} are independently lower alkyl of 1 to 6 carbon atoms; SO₃H; SO₂NR^{IV}R^V, wherein R^{IV} and R^V are independently hydrogen, lower alkyl of 1 to 6 carbon atoms or aminoalkyl of 1 to 6 carbon atoms, provided that R^{IV} and R^V may not both be aminoalkyl; CN; CO₂R^{VI}, wherein R^{VI} is hydrogen or lower alkyl of 1 to 6 carbon atoms; and C(O)NR^{VII}R^{VIII}, wherein R^{VII} and R^{VIII} are independently hydrogen, lower alkyl of 1 to 6 carbon atoms or aminoalkyl of 1 to 6 carbon atoms, provided that R^{VII} and R^{VIII} may not both be aminoalkyl;

 R_1 and R_2 are independently hydrogen, hydroxy, lower alkyl having 1 to 6 carbon atoms, or lower alkoxy having 1 to 6 carbon atoms;

 R_3 and R_4 are independently hydrogen or lower alkyl having 1 to 6 carbon atoms and each R_3 and R_4 is independently selected in each -O-CHR₃-CHR₄- unit;

n is an integer from 0 to 100;

and when n is 0 to 10, then R_5 is a polyalkyl group having an average molecular weight in the range of about 450 to 5,000;

and when n is 5 to 100, then R_5 is hydrogen, alkyl having 1 to 100 carbon atoms, phenyl, aralkyl having 7 to 100 carbon atoms, alkaryl having 7 to 100 carbon atoms, or an acyl group having the formula:

$$\stackrel{\circ}{=}$$
 or $\stackrel{\circ}{=}$ \stackrel

wherein R_6 is alkyl having 1 to 30 carbon atoms, phenyl, aralkyl having 7 to 36 carbon atoms or alkaryl having 7 to 36 carbon atoms;

 R_7 and R_8 are independently hydrogen, hydroxy, lower alkyl having 1 to 6 carbon atoms, or lower alkoxy having 1 to 6 carbon atoms;

 A_2 is selected from the group consisting of SR^{IX} , SOR^X , SO_2R^{XI} , wherein R^{IX} , R^X and R^{XI} are independently lower alkyl of 1 to 6 carbon atoms; SO_3H ; $SO_2NR^{XII}R^{XIII}$, wherein R^{XII} and R^{XIII} are independently hydrogen or lower alkyl of 1 to 6 carbon atoms; CN; CO_2R^{XIV} , wherein R^{XIV} is hydrogen or lower alkyl of 1 to 6 carbon atoms; and $C(O)NR^{XV}R^{XVI}$, wherein R^{XV} and R^{XVI} are independently hydrogen or lower alkyl of 1 to 6 carbon atoms;

-9-

and x and y are independently integers from 0 to 10;

with the proviso that when n and x are both 0, then A_1 may not be CO_2R^{VI} or $C(O)NR^{VII}R^{VIII}$.

The present invention further provides a fuel composition comprising a major amount of hydrocarbons boiling in the gasoline or diesel range and an effective deposit-controlling amount of a polyalkyl or poly(oxyalkylene) aromatic ester of the present invention.

The present invention additionally provides a fuel concentrate comprising an inert stable eleophilic organic solvent boiling in the range of from about 150°F (65°C) to 400°F (205°C) and from about 10 to 70 weight percent of a polyalkyl or poly(exyalkylene) aromatic ester of the present invention.

Among other factors, the present invention is based on the discovery that certain polyalkyl and poly(oxyalkylene) aromatic esters which are substituted on the aromatic moiety are surprisingly useful for reducing engine deposits, especially on intake valves, when employed as fuel additives in fuel compositions.

. 26

DETAILED DESCRIPTION OF THE INVENTION

The fuel additives provided by the present invention have the general formula:

3 0

wherein A_1 , R_1 , R_2 , R_3 , R_4 , R_5 , n and x are as defined above.

In formula I, above, A_1 may be a thioether, SR^I , a sulfoxide, SO_2^{III} , a sulfonic acid, SO_3^{II} , a sulfonamide, $SO_2^{IV}R^V$, a nitrile(cyano), CN, a carboxylic acid or ester, CO_2^{RVI} , or a carboxamide, $C(O)NR^{VII}R^{VIII}$.

Preferably, A_1 is a thioether, SR^I , a sulfone, SO_2R^{III} , a nitrile, CN, a carboxylic acid or ester, CO_2R^{VI} , or a carboxamide, $C(O)NR^{VII}R^{VIII}$. More preferably, A_1 is a carboxylic acid or a carboxylic acid ester, CO_2R^{VI} , or a carboxamide, $C(O)NR^{VII}R^{VIII}$.

Preferably, R_1 is hydrogen, hydroxy, or lower alkyl having 1 to 4 carbon atoms. More preferably, R_1 is hydrogen or hydroxy. Most preferably, R_1 is hydrogen.

R2 is preferably hydrogen.

Preferably, one of R_3 and R_4 is lower alkyl having 1 to 3 carbon atoms and the other is hydrogen. More preferably, one of R_3 and R_4 is methyl or ethyl and the other is hydrogen. Most preferably, one of R_3 and R_4 is ethyl and the other is hydrogen. 07

. 20

21 22

23

24

25 26 27

28

29

30

31 32

34

The number of oxyalkylene groups, n, may range from 0 to 100. When n ranges from 0 to about 10 oxyalkylene groups, then R₅ is a polyalkyl group having an average molecular weight in the range of about 450 to 5,000, preferably in the range of about 500 to 5,000, more preferably about 500 to 3,000, and most preferably about 600 to 2,000.

Moreover, when n ranges from about 5 to 100 oxyalkylene 09 groups, R5 is preferably hydrogen, alkyl having 1 to 10 30 carbon atoms, or alkylphenyl having an alkyl group 11 containing 1 to 30 carbon atoms. More preferably, Rs is 12 hydrogen, alkyl having 2 to 24 carbon atoms, or alkylphenyl 13 having an alkyl group containing 2 to 24 carbon atoms. Still more preferably, R₅ is hydrogen, alkyl having 4 to . 15 12 carbon atoms or alkylphenyl having an alkyl group 16 containing 4 to 12 carbon atoms. Most preferably, Rs is 17 alkylphenyl having an alkyl group containing 4 to 12 carbon 18 atoms. 19

R6 is preferably alkyl having 4 to 12 carbon atoms.

Preferably, R₇ is hydrogen, hydroxy, or lower alkyl having 1 to 4 carbon atoms. More preferably, R₇ is hydrogen or hydroxy. Most preferably, R₇ is hydrogen.

Rg is preferably hydrogen.

Preferably, A_2 is a thioether, SR^{IX} , a sulfone, SO_2R^{XI} , a nitrile, CN, a carboxylic acid or ester, CO_2R^{XIV} , or a carboxamide, $C(O)NR^{XV}R^{XVI}$. More preferably, A_2 is a carboxylic acid or ester, CO_2R^{XIV} , or a carboxamide, $C(O)NR^{XV}R^{XVI}$.

-12-

As indicated above, n is an integer from 0 to 100. In one embodiment of the present invention, where R₅ is a polyalkyl group having an average molecular weight of 450 to 5,000, the number of oxyalkylene groups, n, will generally range from 0 to about 10, preferably from 0 to about 5, and more preferably, n will be 0.

In another embodiment of the present invention, where R_5 is hydrogen, alkyl of 1 to 100 carbon atoms, phenyl, aralkyl of 7 to 100 carbon atoms, alkaryl of 7 to 100 carbon atoms or an acyl group, the number of oxyalkylene groups, n, will generally range from about 5 to 100, preferably from about 8 to 50, and more preferably, n will be an integer from about 10 to 30.

Preferably, x will be an integer from 0 to 2. More preferably, x will be 0. Preferably, y will be an integer from 0 to 2. More preferably, y will be 0.

It is especially preferred that the $A_{\rm I}$ substituent present in the aromatic moiety of the aromatic esters of this invention be situated in a meta or para position relative to the ester moiety. When the aromatic moiety also contains a hydroxyl substituent, it is particularly preferred that this hydroxyl group be in a meta or para position relative to the ester moiety and in an ortho position relative to the $A_{\rm I}$ substituent.

The polyalkyl and poly(oxyalkylene) aromatic esters employed in the present invention will generally have a sufficient molecular weight so as to be non-volatile at normal engine intake valve operating temperatures (about 200-250°C).

Typically, the molecular weight of the polyalkyl and

-13-

poly(oxyalkylene) aromatic esters will range from about 600 to about 10,000, preferably from about 600 to 3,000.

Generally, the poly(oxyalkylene) aromatic esters employed in this invention will contain an average of about 5 to about 100 oxyalkylene units; preferably, 8 to 50 oxyalkylene units; more preferably, 10 to 30 oxyalkylene units.

_10

.14

Fuel-soluble salts of the polyalkyl and poly(oxyalkylene) aromatic esters of the present invention can be readily prepared for those compounds containing an amino group and such salts are contemplated to be useful for preventing or controlling engine deposits. Suitable salts include, for example, those obtained by protonating the amino moiety with a strong organic acid, such as an alkyl- or arylsulfonic acid. Preferred salts are derived from toluenesulfonic acid and methanesulfonic acid.

. 18 . 19

<u>Definitions</u>

As used herein the following terms have the following meanings unless expressly stated to the contrary.

The term "alkyl" refers to both straight- and branched-chain alkyl groups.

 The term "lower alkyl" refers to alkyl groups having 1 to about 6 carbon atoms and includes primary, secondary and tertiary alkyl groups. Typical lower alkyl groups include, for example, methyl, ethyl, n-propyl, isopropyl, n-butyl, sec-butyl, t-butyl, n-pentyl, n-hexyl and the like.

31 ·

 The term "lower alkoxy" refers to the group $-OR_d$ wherein R_d is lower alkyl. Typical lower alkoxy groups include methoxy, ethoxy, and the like.

The term "alkaryl" refers to the group:

R_e

wherein $R_{\rm e}$ and $R_{\rm f}$ are each independently hydrogen or an alkyl group, with the proviso that both $R_{\rm e}$ and $R_{\rm f}$ are not hydrogen. Typical alkaryl groups include, for example, tolyl, xylyl, cumenyl, ethylphenyl, butylphenyl, dioctylphenyl, dibutylphenyl, hexylphenyl, octylphenyl, dioctylphenyl, nonylphenyl, decylphenyl, didecylphenyl, dodecylphenyl, hexadecylphenyl, octadecylphenyl, icosylphenyl, tricontylphenyl and the like. The term "alkylphenyl" refers to an alkaryl group of the above formula in which $R_{\rm e}$ is alkyl and $R_{\rm f}$ is hydrogen.

The term "aralkyl" refers to the group:

R_h

wherein R_g and R_h are each independently hydrogen or an alkyl group; and R_i is an alkylene group. Typical alkaryl groups include, for example, benzyl, methylbenzyl, dimethylbenzyl, phenethyl, and the like.

The term "oxyalkylene unit" or "oxyalkylene group" refers to an ether moiety having the general formula:

wherein R_j and R_k are each independently hydrogen or lower alkyl groups.

The term "poly(oxyalkylene)" refers to a polymer or oligomer having the general formula:

wherein R_j and R_k are as defined above, and z is an integer greater than 1. When referring herein to the number of poly(oxyalkylene) units in a particular poly(oxyalkylene) compound, it is to be understood that this number refers to the average number of poly(oxyalkylene) units in such compounds unless expressly stated to the contrary.

General Synthetic Procedures

The polyalkyl and poly(oxyalkylene) aromatic esters employed in this invention can be prepared by the following general methods and procedures. Those skilled in the art will recognize that where typical or preferred process conditions (e.g., reaction temperatures, times, mole ratios of reactants, solvents, pressures, etc.) are given, other process conditions may also be used unless otherwise stated.

Optimum reaction conditions may vary with the particular reactants or solvents used, but one skilled in the art will

be able to determine such conditions by routine optimization
procedures.

Moreover, those skilled in the art will recognize that it may be necessary to block or protect certain functional groups while conducting the following synthetic procedures. In such cases, the protecting group will serve to protect the functional group from undesired reactions or to block its undesired reaction with other functional groups or with the reagents used to carry out the desired chemical transformations. The proper choice of a protecting group for a particular functional group will be readily apparent to one skilled in the art. Various protecting groups and their introduction and removal are described, for example, in T. W. Greene and P. G. M. Wuts, Protective Groups in Organic Synthesis, Second Edition, Wiley, New York, 1991, and references cited therein.

In the present synthetic procedures, a hydroxyl group, if present, will preferably be protected, when necessary, as the benzyl or tert-butyldimethylsilyl ether. Introduction and removal of these protecting groups is well described in the art.

The polyalkyl and poly(oxyalkylene) aromatic esters of the present invention having the formula:

wherein A_1 , R_1 - R_4 , n and x are as defined above and R_{12} is an alkyl, phenyl, aralkyl, alkaryl or polyalkyl group, may be prepared by esterifying an aromatic carboxylic acid having the formula:

..

•••

wherein A_1 , R_1 , R_2 and x are as defined above, with an alcohol having the formula:

. 18

. 20

wherein n is 0 to 100 and R_3 , R_4 and R_{12} are as defined above, using conventional esterification reaction conditions.

. 26

. 29

This reaction is typically conducted by contacting the alcohol V with about 0.25 to about 1.5 molar equivalents of aromatic carboxylic acid IV in the presence of an acidic catalyst at a temperature in the range of 70°C to about 160°C for about 0.5 to about 48 hours. Suitable acid catalysts for this reaction include, for example, p-toluenesulfonic acid, methanesulfonic acid, sulfuric acid and the like. The reaction may be conducted in the presence or absence of an inert solvent, such as toluene, xylene and the like. The water generated during this reaction may be continuously removed by conventional procedures, such as

32

33

34

01 azeotropic distillation with an inert solvent, such as 02 xvlene. 03 04 Alternatively, the polyalkyl and poly(oxyalkylene) aromatic 05 esters of formula III may be prepared by reacting the 06 alcohol V with an acid halide derived from aromatic 07 carboxylic acid IV, such as an acid chloride or acid 80 bromide. 09 10 Generally, the carboxylic acid moiety of IV may be converted 11 into an acyl halide moiety by contacting IV with an 12 inorganic acid halide, such as thionyl chloride, phosphorous 13 trichloride, phosphorous tribromide, or phosphorous 14 pentachloride; or with oxalyl chloride. Typically, this 15 reaction will be conducted using about 1 to 5 molar 16 equivalents of the inorganic acid halide or oxalyl chloride, 17 either neat or in an inert solvent, such as diethyl ether, 18 at a temperature in the range of about 20°C to about 80°C 19 for about 1 to about 48 hours. A catalyst, such as 20 N, N-dimethylformamide, may also be used in this reaction. 21 22 Reaction of the acid halide derived from IV with the alcohol 23 V provides a polyalkyl or poly(oxyalkylene) aromatic ester 24 of formula III. Typically, this reaction is conducted by 25 contacting alcohol V with about 0.25 to about 1.5 molar 26 equivalents of the acid halide in an inert solvent, such as 27 toluene, dichloromethane, diethyl ether, and the like, at a 28 temperature in the range of about 25°C to about 150°C. The 29 reaction is generally complete in about 0.5 to about 30 48 hours. Preferably, the reaction is conducted in the 31 presence of a sufficient amount of an amine capable of

neutralizing the acid generated during the reaction, such as

triethylamine, di(isopropyl)ethylamine, pyridine or

4-dimethylaminopyridine.

-19-

The aromatic carboxylic acids of formula IV employed in the above-described procedures are either known compounds or can be prepared from known compounds by conventional procedures.

Representative aromatic carboxylic acids suitable for use in these reactions include, for example, 4-methythiobenzoic acid, 4-methylsulfoxybenzoic acid, 4-methylsulfoxybenzoic acid, 4-methylsulfoxybenzoic acid, 4-cyanobenzoic acid, mono-methyl terephthalic acid, 4-carboxybenzenesulfonamide, 4-carboxybenzenesulfonic acid, and the like.

Preferred aromatic carboxylic acids include

4-methylthiobenzoic acid, 4-methylsulfonylbenzoic acid,
4-cyanobenzoic acid, and mono-methyl terephthalic acid.

Alternatively, substituent A₁ can be further modified by conventional procedures well known to those skilled in the art to provide additional aromatic compounds encompassed by formula III, above.

The alcohols of formula V, above, will include polyalkyl alcohols, R_{12} OH, where the number of oxyalkylene groups, n, is 0 and R_{12} is polyalkyl.

The polyalkyl alcohols for formula V having no oxyalkylene groups may be prepared by conventional procedures known in the art. Such procedures are taught, for example, in U.S. Patent Nos. 5,055,607 to Buckley and 4,859,210 to Franz et al., the disclosures of which are incorporated herein by reference.

In general, the polyalkyl substituent on the polyalkyl alcohols of formula V and the resulting polyalkyl aromatic esters of the present invention will have an average

-20-

01 molecular weight in the range of about 450 to 5,000, preferably about 500 to 5,000, more preferably about 500 to 02 03 3,000, and most preferably about 600 to 2,000. 04 05 The polyalkyl substituent on the polyalkyl alcohols employed 06 in the invention may be generally derived from polyolefins 07 which are polymers or copolymers of mono-olefins, 08 particularly 1-mono-olefins, such as ethylene, propylene, 09 butylene, and the like. Preferably, the mono-olefin employed will have 2 to about 24 carbon atoms, and more 10 11 preferably, about 3 to 12 carbon atoms. More preferred 12 mono-olefins include propylene, butylene, particularly 13 isobutylene, 1-octene and 1-decene. Polyolefins prepared 14 from such mono-olefins include polypropylene, polybutene, especially polyisobutene, and the polyalphaolefins produced 15 16 from 1-octene and 1-decene. 17 18 The preferred polyisobutenes used to prepare the presently 19 employed polyalkyl alcohols are polyisobutenes which 20 comprise at least about 20% of the more reactive methylvinylidene isomer, preferably at least 50%, and more 21 22 preferably at least 70%. Suitable polyisobutenes include those prepared using BF_3 catalysts. The preparation of such 23 24 polyisobutenes in which the methylvinylidene isomer 25 comprises a high percentage of the total composition is 26 described in U.S. Patent Nos. 4,152,499 and 4,605,808. Such 27 polyisobutenes, known as "reactive" polyisobutenes, yield 28 high molecular weight alcohols in which the hydroxyl group 29 is at or near the end of the hydrocarbon chain. 30 31 Examples of suitable polyisobutenes having a high 32 alkylvinylidene content include Ultravis 30, a polyisobutene

having a molecular weight of about 1300 and a

33

methylvinylidene content of about 74%, and Ultravis 10, a polyisobutene having a molecular weight of about 950 and a methylvinylidene content of about 76%, both available from British Petroleum.

The polyalkyl alcohols may be prepared from the corresponding olefins by conventional procedures. -08 procedures include hydration of the double bond to give an alcohol. Suitable procedures for preparing such long-chain alcohols are described in I. T. Harrison and S. Harrison, Compendium of Organic Synthetic Methods, Wiley-Interscience, New York (1971), pp. 119-122, as well as in U.S. Patent Nos. 5,055,607 and 4,859,210.

.05

The alcohols of formula V, above, will also include poly(oxyalkylene) alcohols, where the number of oxyalkylene units, n, is greater than 0, that is, from 1 to about 100.

The poly(oxyalkylene) alcohols of formula V are also known compounds that can be prepared using conventional procedures. For example, suitable procedures for preparing such compounds are taught in U.S. Patent Nos. 2,782,240 and 2,841,479, the disclosures of which are incorporated herein by reference.

Preferably, the poly(oxyalkylene) alcohols of formula V are prepared by contacting an alkoxide or phenoxide metal salt having the formula:

R₁₂OM (VI

wherein \mathbf{R}_{12} is as defined above and M is a metal cation, such as lithium, sodium, potassium and the like, with about

1 to about 100 molar equivalents of an alkylene oxide (an epoxide) having the formula:

/\ R₃-HC-CH-R

(VII)

wherein R3 and R4 are as defined above.

Typically, metal salt VI is prepared by contacting the corresponding hydroxy compound R₁₂OH with a strong base, such as sodium hydride, potassium hydride, sodium amide and the like, in an inert solvent, such as toluene, xylene and the like, under substantially anhydrous conditions at a temperature in the range from about -10°C to about 120°C for about 0.25 to about 3 hours.

Metal salt VI is generally not isolated, but is reacted in situ with alkylene oxide VII to provide, after neutralization, the poly(oxyalkylene) alcohol V. This polymerization reaction is typically conducted in a substantially anhydrous inert solvent at a temperature of about 30°C to about 150°C for about 2 to about 120 hours. Suitable solvents for this reaction, include toluene, xylene and the like. Typically, the reaction is conducted at a pressure sufficient to contain the reactants and the solvent, preferably at atmospheric or ambient pressure.

The amount of alkylene oxide employed in this reaction will generally depend on the number of oxyalkylene units desired in the product. Typically, the molar ratio of alkylene oxide VII to metal salt VI will range from about 1:1 to 100:1, preferably from 5:1 to about 100:1, more preferably from 8:1 to 50:1, and most preferably from 10:1 to 30:1.

-23-

Alkylene oxides suitable for use in this polymerization
reaction include, for example, ethylene oxide; propylene
oxide; butylene oxides, such as 1,2-butylene oxide
(1,2-epoxybutane) and 2,3-butylene oxide (2,3-epoxybutane);
pentylene oxides; hexylene oxides; octylene oxides and the
like. Preferred alkylene oxides are propylene oxide and
1,2-butylene oxide.

80

10

11

12.

13

14

16

In the polymerization reaction, a single type of alkylene oxide may be employed, e.g., propylene oxide, in which case the product is a homopolymer, e.g., a poly(oxypropylene) polymer. Copolymers are equally satisfactory and random copolymers can be prepared by contacting metal salt VI with a mixture of alkylene oxides, such as a mixture of propylene oxide and 1,2-butylene oxide, under polymerization conditions. Copolymers containing blocks of oxyalkylene units are also suitable for use in this invention. Block copolymers can be prepared by contacting metal salt VI with first one alkylene oxide, then others in any order, or repetitively, under polymerization conditions.

21

19

20 ..

22 Poly(oxyalkylene) copolymers prepared by terminating or 23 capping the poly(oxyalkylene) moiety with 1 to 24 10 oxyethylene units, preferably 2 to 5 oxyethylene units, 25 are particularly useful in the present invention, since 26 these copolymers have been found to be more readily 27 esterified than those having an alkyl branch in the terminal 28 oxyalkylene unit. These copolymers may be prepared by 29 contacting metal salt IV with an alkylene oxide of formula 30 VII, such as 1,2-butylene oxide or propylene oxide, under polymerization conditions and then capping or terminating 31 the resulting block of oxyalkylene units with oxyethylene 33 units by adding ethylene oxide.

The poly(oxyalkylene) alcohol V may also be prepared by living or immortal polymerization as described by S. Inoue and T. Aida in Encyclopedia of Polymer Science and Engineering, Second Edition, Supplemental Volume, J. Wiley and Sons, New York, pages 412-420 (1989). These procedures are especially useful for preparing poly(oxyalkylene) alcohols of formula V in which R_3 and R_4 are both alkyl groups.

As noted above, the alkoxide or phenoxide metal salt VI used in the above procedures is generally derived from the corresponding hydroxy compound, $R_{12}OH$. Suitable hydroxy compounds include straight— or branched—chain aliphatic alcohols having 1 to about 100 carbon atoms and phenols having the formula:

(VIII)

wherein R_{13} is an alkyl group having 1 to about 100 carbon atoms and R_{14} is hydrogen; or R_{13} and R_{14} are both alkyl groups, each independently containing 1 to about 50 carbon atoms.

Representative examples of straight- or branched-chain aliphatic alcohols suitable for use in this invention include, but are not limited to, n-butanol; isobutanol; sec-butanol; t-butanol; n-pentanol; n-hexanol; n-heptanol; n-octanol; isooctanol; n-nonanol; n-decanol; n-decanol; n-hexadecanol (cetyl alcohol); n-octadecanol (stearyl alcohol); alcohols derived from linear C10 to C30 alpha

olefins and mixtures thereof; and alcohols derived from
polymers of C₂ to C₆ olefins, such as alcohols derived from
polypropylene and polybutene, including polypropylene
alcohols having 9 to about 100 carbon atoms and polybutylene
alcohols having 12 to about 100 carbon atoms. Preferred
straight- or branched-chain aliphatic alcohols will contain
to about 30 carbon atoms, more preferably 2 to about
carbon atoms, and most preferably 4 to 12 carbon atoms.
Particularly preferred aliphatic alcohols are butanols.

10 11

12

13

14

The phenols of formula VIII may be monoalkyl-substituted phenols or dialkyl-substituted phenols. Monoalkyl-substituted phenols are preferred, especially monoalkylphenols having an alkyl substituent in the paraposition.

.16

17 Preferably, the alkyl group of the alkylphenol will contain 1 to about 30 carbon atoms, more preferably 2 to 24 carbon atoms, and most preferably 4 to 12 carbon atoms. 20 Representative examples of phenols suitable for use in this 21 invention include, but are not limited to, phenol, .22 methylphenol, dimethylphenol, ethylphenol, butylphenol, 23 octylphenol, decylphenol, dodacylphenol, tetradecylphenol, 24 hexadecylphenol, octadecylphenol, eicosylphenol, tetracosylphenol, hexacosylphenol, triacontylphenol and the 26 like. Also, mixtures of alkylphenols may be employed, such 27 as a mixture of C_{14} - C_{18} alkylphenols, a mixture of C_{18} - C_{24} 28 alkylphenols, a mixture of C_{20} - C_{24} alkylphenols, or a mixture 29 of C16-C26 alkylphenols. 30

31

32

Particularly preferred alkylphenols are prepared by alkylating phenol with polymers or oligomers of C_3 to C_6 olefins, such as polypropylene or polybutene. These

polymers typically contain 8 to about 100 carbon atoms, preferably 10 to 30 carbon atoms. An especially preferred alkylphenol is prepared by alkylating phenol with a propylene polymer having an average of four units. This polymer has the common name of propylene tetramer and is commercially available.

The poly(oxyalkylene) aromatic esters of formula I wherein R_5 is hydrogen, i.e., compounds having the formula:

$$R_1 \xrightarrow{A_1} O R_3 R_4$$

$$R_1 \xrightarrow{\downarrow} (CH_2)_x - C - (O - CH - CH)_n - OH$$

$$(IX)$$

wherein A_1 , R_1 - R_4 , n and x are as defined above, may be prepared from compounds of formula III wherein R12 is a labile hydrocarbyl group, such as a benzyl or t-butyl group, by removing the hydrocarbyl group under appropriate conditions to provide a hydroxyl group. For example, compounds of formula III where R12 represents a benzyl group may be prepared by employing a metal salt VI derived from benzyl alcohol in the above-described synthetic procedures. Cleavage of the benzyl ether using conventional hydrogenolysis procedures then provides a compound of formula IX. Other labile hydrocarbyl groups, such as a t-butyl group, may be similarly employed for those compounds having functional groups that are not compatible with hydrogenolysis conditions, such as nitro groups. t-Butyl ethers may be cleaved under acidic conditions using, for example, trifluoroacetic acid.

.03

33.

The poly(oxyalkylene) aromatic esters of formula I wherein R₅ is an acyl group, i.e., compounds having the formula:

$$R_1$$
 $(CH_2)_x$
 $-C$
 $(O-CH-CH)_n$
 $-OR_{15}$
 (X)

wherein A_1 , R_1 - R_4 , n and x are as defined above and R_{15} is an acyl group having the formula:

$$\stackrel{\circ}{\mathbb{I}}_{-C-R_6}$$
 or $\stackrel{\circ}{-C-(CH_2)_y}$ $\stackrel{A_2}{\longrightarrow}_{R_8}$

wherein A_2 , R_6 - R_8 and y are as defined above, may be synthesized from a compound of formula IX by acylating the terminal hydroxyl group of the poly(oxyalkylene) moiety with a suitable acylating agent.

Acylating agents suitable for use in this reaction include acid halides, such as acid chlorides and bromides; and carboxylic acid anhydrides. Preferred acylating agents include those having the formula: $R_6C(0)-X$, wherein R_6 is alkyl having 1 to 30, preferably 4 to 12 carbon atoms, phenyl, aralkyl having 7 to 36 carbon atoms or alkaryl having 7 to 36 carbon atoms, and X is chloro or bromo; and the acid halide derivatives of aromatic carboxylic acid IV described hereinabove.

Representative examples of preferred acylating agents having the formula R₆C(0)-X include acetyl chloride, propionyl chloride, butanoyl chloride, pivaloyl chloride, octanoyl chloride, decanoyl chloride and the like.

Typically, acylation of IX is conducted by contacting IX with about 0.95 to about 1.2 molar equivalents of the acylating agent in an inert solvent, such as toluene, dichloromethane, diethyl ether and the like, at a temperature in the range of about 25°C to about 150°C for about 0.5 to about 48 hours. When an acid halide is employed as the acylating agent, the reaction is preferably conducted in the presence of a sufficient amount of an amine capable of neutralizing the acid generated during the reaction, such as triethylamine, di(isopropyl)ethylamine, pyridine or 4-dimethylamino pyridine.

A preferred group of poly(oxyalkylene) aromatic esters of formula X are those having the same aromatic ester group at each end of the poly(oxyalkylene) moiety, i.e., compounds of formula X wherein R_{15} is an acyl group having the formula:

wherein $A_2 = A_1$; $R_7 = R_1$; $R_8 = R_2$; and x and y are the same integer.

These compounds may be prepared from a poly(oxyalkylene) diol having the formula:

-29-

(XI)

wherein R₃, R₄, and n are as defined above, by esterifying each of the hydroxyl groups present in XI with a aromatic carboxylic acid of formula IV or an acyl halide derivative thereof using the above-described synthetic procedures. The poly(oxyalkylene) diols of formula XI are commercially available or may be prepared by conventional procedures, for example, by using sodium or potassium hydroxide in place of the alkoxide or phenoxide metal salt VI in the above-described alkylene oxide polymerization reaction.

Fuel Compositions

.09

11.

The polyalkyl and poly(oxyalkylene) aromatic esters of the present invention are useful as additives in hydrocarbon fuels to prevent and control engine deposits, particularly intake valve deposits. Typically, the desired deposit control is achieved by operating an internal combustion engine with a fuel composition containing a polyalkyl or poly(oxyalkylene) aromatic ester of the present invention. The proper concentration of additive necessary to achieve the desired level of deposit control varies depending upon the type of fuel employed, the type of engine, and the presence of other fuel additives.

In general, the concentration of the polyalkyl and poly(oxyalkylene) aromatic esters of this invention in hydrocarbon fuel will range from about 50 to about 2500 parts per million (ppm) by weight, preferably from 75 to 1,000 ppm. When other deposit control additives are

-30-

01 present, a lesser amount of the present additive may be 02 used. 03 04 The polyalkyl and poly(oxyalkylene) aromatic esters of the 05 present invention may also be formulated as a concentrate 06 using an inert stable oleophilic (i.e., dissolves in 07 gasoline) organic solvent boiling in the range of about 80 150°F to 400°F (about 65°C to 205°C). Preferably, an 09 aliphatic or an aromatic hydrocarbon solvent is used, such 10 as benzene, toluene, xylene or higher-boiling aromatics or 11 aromatic thinners. Aliphatic alcohols containing about 3 to 12 8 carbon atoms, such as isopropanol, isobutylcarbinol, 13 n-butanol and the like, in combination with hydrocarbon 14 solvents are also suitable for use with the present 15 additives. In the concentrate, the amount of the additive 16 will generally range from about 10 to about 70 weight 17 percent, preferably 10 to 50 weight percent, more preferably 18 from 20 to 40 weight percent. 19 20 In gasoline fuels, other fuel additives may be employed with 21 the additives of the present invention, including, for 22 example, oxygenates, such as t-butyl methyl ether, antiknock 23 agents, such as methylcyclopentadienyl manganese 24 tricarbonyl, and other dispersants/detergents, such as 25 hydrocarbyl amines, hydrocarbyl poly(oxyalkylene) amines, or 26 succinimides. Additionally, antioxidants, metal 27 deactivators and demulsifiers may be present. 28 29 In diesel fuels, other well-known additives can be employed, 30 such as pour point depressants, flow improvers, cetane 31 improvers, and the like. 32 33 A fuel-soluble, nonvolatile carrier fluid or oil may also be

used with the polyalkyl and poly(oxyalkylene) aromatic

-31-

esters of this invention. The carrier fluid is a chemically inert hydrocarbon-soluble liquid vehicle which substantially 03 increases the nonvolatile residue (NVR), or solvent-free 04 liquid fraction of the fuel additive composition while not 05 overwhelmingly contributing to octane requirement increase. The carrier fluid may be a natural or synthetic oil, such as 07 mineral oil, refined petroleum oils, synthetic polyalkanes and alkenes, including hydrogenated and unhydrogenated .09 polyalphaolefins, synthetic polyoxyalkylene-derived oils, such as those described, for example, in U.S. Patent : 11 No. 4,191,537 to Lewis, and polyesters, such as those 12 described, for example, in U.S. Patent Nos. 3,756,793 and 5,004,478 to Robinson and Vogel et al., respectively, and in 13 14 European Patent Application Nos. 356,726 and 382,159, 15 published March 7, 1990 and August 16, 1990, respectively. 16

These carrier fluids are believed to act as a carrier for the fuel additives of the present invention and to assist in removing and retarding deposits. The carrier fluid may also exhibit synergistic deposit control properties when used in combination with a polyalkyl or poly(oxyalkylene) aromatic ester of this invention.

22 23 24

25

.26

27

28

21

17

18

19. 20

The carrier fluids are typically employed in amounts ranging from about 100 to about 5000 ppm by weight of the hydrocarbon fuel, preferably from 400 to 3000 ppm of the fuel. Preferably, the ratio of carrier fluid to deposit control additive will range from about 0.5:1 to about 10:1, more preferably from 1:1 to 4:1, most preferably about 2:1.

. 29 . 30

> When employed in a fuel concentrate, carrier fluids will generally be present in amounts ranging from about 20 to about 60 weight percent, preferably from 30 to 50 weight percent.

WO 95/17485

01 <u>EXAMPLES</u>

The following examples are presented to illustrate specific embodiments of the present invention and synthetic preparations thereof; and therefore these examples should not be interpreted as limitations upon the scope of this invention.

Example 1

Preparation of 4-Methylthiobenzovl Chloride

To a flask equipped with a magnetic stirrer and a drying tube was added 10.0 grams of 4-methylthiobenzoic acid, 150 mL of anhydrous dichloromethane, and then 13 mL of oxalyl chloride. The resulting mixture was stirred at room temperature for 16 hours and then the solvents removed in vacuo to yield 13.1 grams of the desired acid chloride as an orange yellow solid.

Example 2

Preparation of 4-Methylsulfonylbenzovl Chloride

To a flask equipped with a magnetic stirrer and a drying tube was added 10.0 grams of 4-methylsulfonylbenzoic acid, 150 mL of anhydrous dichloromethane, and then 10.9 mL of oxalyl chloride. 1 mL of anhydrous N,N-dimethylformamide was then added. The resulting mixture was stirred at room temperature for 16 hours and then the solvents removed in vacuo to yield 12.8 grams of the desired acid chloride as a light yellow solid.

4-Methylthiobenzoyl chloride (13.1 grams, from Example 1) was combined with 123.3 grams of α-hydroxy-ω-4dodecylphenoxypoly(oxybutylene) having an average of 22 oxybutylene units (prepared essentially as described in Example 6 of U.S. Patent No. 4,160,648) and 500 mL of anhydrous toluene. Triethylamine (9.8 mL) and 4-dimethylamino pyridine (4.08 grams) were then added and the resulting mixture was heated to reflux under nitrogen for 16 hours. The reaction was cooled to room temperature " and diluted with 1 liter of diethyl ether. The organic layer was then washed with 1% aqueous hydrochloric acid, twice with saturated aqueous sodium bicarbonate solution, and once with saturated aqueous sodium chloride. The organic layer was then dried over anhydrous magnesium sulfate, filtered and the solvents removed in vacuo to yield 122.1 grams of the desired product as a brown oil. The oil was chromatographed on silica gel, eluting with hexane/ethyl acetate/ethanol (90:8:2) to afford 60.0 grams of the desired product as a yellow oil. The product had an average of 22 oxybutylene units. ¹H NMR (CDCl₃) δ 7.95, 7.3 (AB quartet, 4H), 7.1-7.3 (m, 2H), 6.75-6.95 (m, 2H), 5.05-5.2 (m, 1H), 3.85-4.0 (m, 2H), 3.1-3.85 (m, 63H), 2.5 (s, 3H), 0.6-1.8 (m, 135H).

Preparation of Polvisobutyl-4-methylsulfonylbenzoate

To a flask equipped with a mechanical stirrer, thermometer 29 Dean-Stark trap, reflux condensor and nitrogen inlet was 30 added 21.0 grams of polyisobutanol (molecular weight average 31 984, prepared via hydroformylation of Amoco H-100 polyisobutene), 7.23 grams of 4-methylsulfonylbenzoic acid and 0.52 grams of p-toluenesulfonic acid. The mixture was

stirred at 130°C for 16 hours, cooled to room temperature, and diluted with 500 mL of diethyl ether. The organic phase was washed twice with saturated aqueous sodium bicarbonate solution, and once with saturated aqueous sodium chloride. The organic layer was then dried over anhydrous magnesium sulfate, filtered and the solvents removed in vacuo to yield 14.5 grams of the desired product as a brown oil. The oil was chromatographed on silica gel, eluting with hexane/ethyl acetate/ethanol (90:8:2) to afford 8.7 grams of the desired product as a yellow oil. IR (neat) 1729 cm⁻¹; ¹H NMR (CDCl₃) & 8.5, 8.1 (AB quartet, 4H), 4.35 (t, 2H), 3.1 (s, 3H), 0.6-1.8 (m, 137H).

Example 7

Preparation of

<u>α-(4-Cyanobenzoyl)-ω-4-dodecylphenoxypoly(oxybutylene)</u>

4-Cyanobenzoyl chloride (3.31 grams) was combined with 36.0 grams of α-hydroxy-ω-4-dodecylphenoxypoly(oxybutylene) having an average of 22 oxybutylene units (prepared essentially as described in Example 6 of U.S. Patent No. 4,160,648) and 250 mL of anhydrous toluene. Triethylamine (3.9 mL) and 4-dimethylamino pyridine (1.5 grams) were then added and the resulting mixture was heated to reflux under nitrogen for 16 hours. The reaction was cooled to room temperature and diluted with 500 mL of hexane. The organic layer was then washed with 1% aqueous hydrochloric acid, twice with saturated aqueous sodium

bicarbonate solution, and once with saturated aqueous sodium chloride. The organic layer was then dried over anhydrous magnesium sulfate, filtered and the solvents removed in vacuo to yield 44.5 grams of the desired product as a 05 brown oil. The oil was chromatographed on silica gel, eluting with hexane/ethyl acetate/ethanol (70:25:5) to afford 22.0 grams of the desired product as a yellow oil. The product had an average of 22 oxybutylene units. IR (neat) 2233, 1722 cm⁻¹; ¹H NMR (CDC1₃) & 8.2, 7.75 (AB quartet, 4H), 7.1-7.3 (m, 2H), 6.75-6.95 (m, 2H), 5.1-5.3 (m, 1H), 3.85-4.0 (m, 2H), 3.1-3.85 (m, 63H), 0.6-1.8 (m,

To a flask equipped with a magnetic stirrer and nitrogen inlet was added α-(4-carbomethoxybenzoyl)-ω-4dodecylphenoxypoly(oxybutylene) (18 grams, from Example 9) 10% aqueous sodium hydroxide (w/w, 4.0 grams), and tetrahydrofuran (10 mL). The reaction was stirred at room temperature for 16 hours and the solvents removed in vacuo. The residue was diluted with 100 mL of water and acidified to pH 3 with concentrated hydrochloric acid. The aqueous layer was extracted three times with diethyl ether. The combined diethyl ether layers were dried over anhydrous. magnesium sulfate, filtered and the solvents removed in vacuo to yield 13.8 grams as an oil. The oil was chromatographed on silica gel, eluting with hexane/diethyl ether (1:1), followed by hexane/diethyl ether/acetic acid (50:45:5) to afford 5.8 grams of the desired product. The product had an average of 18 oxybutylene units. IR (neat) 1722 cm⁻¹; ¹H NMR (CDCl₃) δ 8.05 (s, 4H), 7.0-7.2 (m, 2H), 6.7-6.9 (m, 2H), 5.1-5.25 (m, 1H), 3.85-4.0 (m, 2H), 3.1-3.85 (m, 51H), 0.6-1.8 (m, 115H).

Example 11

Preparation of α-(mono-Terephthaloy1)-ω-4-dodecylphenoxypoly(oxybutylene) chloride

To a flask equipped with a magnetic stirrer and a drying tube was added 18.5 grams of α -(4-carboxybenzoyl)- ω -4-dodecylphenoxypoly(oxybutylene), 150 mL of anhydrous diethyl ether, and then 3 mL of oxalyl chloride. The resulting

mixture was stirred at room temperature for 16 hours and then the solvents removed in vacuo to yield 18.5 grams of the desired acid chloride.

Single-Cylinder Engine Test

04 05

The test compounds were blended in gasoline and their deposit reducing capacity determined in an ASTM/CFR single-cylinder engine test.

07

11

12

13

16

17

19

A Wawkesha CFR single-cylinder engine was used. Each run was carried out for 15 hours, at the end of which time the intake valve was removed, washed with hexane and weighed. The previously determined weight of the clean valve was subtracted from the weight of the value at the end of the run. The differences between the two weights is the weight of the deposit. A lesser amount of deposit indicates a superior additive. The operating conditions of the test were as follows: water jacket temperature 200°F; vacuum of 12 in Hg, air-fuel ratio of 12, ignition spark timing of 40° BTC; engine speed is 1800 rpm; the crankcase oil is a commercial 30W oil.

20

22

.-23

The amount of carbonaceous deposit in milligrams on the intake valves is reported for each of the test compounds in Table I.

¹ At 200 parts per million actives (ppma).

The base fuel employed in the above single-cylinder engine tests was a regular octane unleaded gasoline containing no fuel detergent. The test compounds were admixed with the base fuel to give a concentration of 200 ppma (parts per million actives).

The data in Table I illustrates the significant reduction in intake valve deposits provided by the polyalkyl and poly(oxyalkylene) aromatic esters of the present invention (Examples 3-7, 9-10 and 12-15) compared to the base fuel and the poly(oxyalkylene) aromatic ester of Comparative Example A.

WHAT IS CLAIMED IS:

A compound of the formula:

LU

 - 23. A fuel composition comprising a major amount of hydrocarbons boiling in the gasoline or diesel range and an effective detergent amount of a compound of the formula:

wherein A₁ is selected from the group consisting of SR^I, SO₂R^{III}, wherein R^I, R^{II} and R^{III} are independently lower alkyl of 1 to 6 carbon atoms; SO₃H; SO₂NR^{IV}R^V, wherein R^{IV} and R^V are independently hydrogen, lower alkyl of 1 to 6 carbon atoms or aminoalkyl of 1 to 6 carbon atoms, provided that R^{IV} and R^V may not both be aminoalkyl; CN; CO₂R^{VI}, wherein R^{VI} is hydrogen or lower alkyl of 1 to 6 carbon atoms; and C(O)NR^{VII}R^{VIII}, wherein R^{VII} and R^{VIII} are independently hydrogen, lower alkyl of 1 to 6 carbon atoms or aminoalkyl of 1 to 6 carbon atoms, provided that R^{VII} and R^{VIII} may not both be aminoalkyl;

 R_1 and R_2 are independently hydrogen, hydroxy, lower alkyl having 1 to 6 carbon atoms, or lower alkoxy having 1 to 6 carbon atoms;

 R_3 and R_4 are independently hydrogen or lower alkyl having 1 to 6 carbon atoms and each R_3 and R_4 is independently selected in each -O-CHR₃-CHR₄- unit;

n is an integer from 0 to 100;

and when n is 0 to 10, then R_5 is a polyalkyl group having an average molecular weight in the range of about 450 to 5,000;

and when n is 5 to 100, then R_5 is hydrogen, alkyl having 1 to 100 carbon atoms, phenyl, aralkyl having 7 to 100 carbon atoms, alkaryl having 7 to 100 carbon atoms, or an acyl group having the formula:

$$-C-R_6$$
 or $-C-(CH_2)_y$

wherein R_6 is alkyl having 1 to 30 carbon atoms, phenyl, aralkyl having 7 to 36 carbon atoms or alkaryl having 7 to 36 carbon atoms;

 R_7 and R_8 are independently hydrogen, hydroxy, lower alkyl having 1 to 6 carbon atoms, or lower alkoxy having 1 to 6 carbon atoms;

31

-53-

A₂ is selected from the group consisting of SR^{IX}, SOR^X,

SO₂R^{XI}, wherein R^{IX}, R^X and R^{XI} are independently lower

alkyl of 1 to 6 carbon atoms; SO₃H; SO₂NR^{XIII}R^{XIII}, wherein

R^{XIII} and R^{XIII} are independently hydrogen or lower alkyl

of 1 to 6 carbon atoms; CN; CO₂R^{XIV}, wherein R^{XIV} is

hydrogen or lower alkyl of 1 to 6 carbon atoms; and

C(O)NR^{XV}R^{XVI}, wherein R^{XV} and R^{XVI} are independently

hydrogen or lower alkyl of 1 to 6 carbon atoms;

and x and y are independently integers from 0 to 10;

with the proviso that when n and x are both 0, then A_1 may not be CO_2R^{VI} or $C(0)NR^{VII}R^{VIII}$.

24. The fuel composition according to Claim 23 wherein R₁
is hydrogen, hydroxy or lower alkyl having 1 to
4 carbon atoms.

20 25. The fuel composition according to Claim 24 wherein R_1 21 is hydrogen or hydroxy.

23 26. The fuel composition according to Claim 25 wherein R_1 24 is hydrogen.

26 27. The fuel composition according to Claim 23 wherein \mathbb{R}_2 is hydrogen.

29 28. The fuel composition according to Claim 23 wherein x is 30 an integer from 0 to 2.

32 29. The fuel composition according to Claim 28 wherein x is 0.

31. The fuel composition according to Claim 30 wherein n isan integer from 0 to 5.

06

09

32. The fuel composition according to Claim 31 wherein n is0.

10 33. The fuel composition according to Claim 30 wherein R_1 11 and R_2 are both hydrogen and x and n are both 0.

34. The fuel composition according to Claim 30 wherein R₅
 is a polyalkyl group derived from polypropylene,
 polybutene, or polyalphaolefin oligomers of 1-octene or
 1-decene.

18 35. The fuel composition according to Claim 34 wherein R_5 is a polyalkyl group derived from polyisobutene.

21
22
23
36. The fuel composition according to Claim 23 wherein n is an integer from 5 to 100.

37. The fuel composition according to Claim 36 wherein n is an integer from 8 to 50.

27
28
28
29
The fuel composition according to Claim 37 wherein n is an integer from 10 to 30.

30
31
32
33
39. The fuel composition according to Claim 36 wherein R₅
is hydrogen, alkyl having 1 to 30 carbon atoms or
alkylphenyl having an alkyl group containing 1 to
30 carbon atoms.

20

- of R₃ and R₄ is lower alkyl having 1 to 3 carbon atoms
 and the other is hydrogen.
- of R₃ and R₄ is methyl or ethyl and the other is hydrogen.
- 42. The fuel composition according to Claim 36 wherein R_1 and R_2 are hydrogen, R_5 is alkylphenyl having an alkyl group containing 4 to 12 carbon atoms, and x is 0.
- 43. The fuel composition according to Claim 23 wherein A_1 is selected from the group consisting of SR^I , SO_2R^{III} , CN, CO_2R^{VI} and $C(O)NR^{VII}R^{VIII}$.
- 17
 18 44. The fuel composition according to Claim 43 wherein A_1 19 is CO_2R^{VI} or $C(O)NR^{VII}R^{VIII}$.
- 21 45. A fuel concentrate comprising an inert stable
 22 oleophilic organic solvent boiling in the range of from
 23 about 150°F to 400°F and from about 10 to about
 24 70 weight percent of a compound of the formula:

wherein A_1 is selected from the group consisting of SR^I , SOR^{II} , SO_2R^{III} , wherein R^I , R^{II} and R^{III} are

independently lower alkyl of 1 to 6 carbon atoms; SO₃H; SO₂NR^{IV}R^V, wherein R^{IV} and R^V are independently hydrogen, lower alkyl of 1 to 6 carbon atoms or aminoalkyl of 1 to 6 carbon atoms, provided that R^{IV} and R^V may not both be aminoalkyl; CN; CO₂R^{VI}, wherein R^{VI} is hydrogen or lower alkyl of 1 to 6 carbon atoms; and C(O)NR^{VII}R^{VIII}, wherein R^{VII} and R^{VIII} are independently hydrogen, lower alkyl of 1 to 6 carbon atoms or aminoalkyl of 1 to 6 carbon atoms, provided that R^{VII} and R^{VIII} may not both be aminoalkyl;

 R_1 and R_2 are independently hydrogen, hydroxy, lower alkyl having 1 to 6 carbon atoms, or lower alkoxy having 1 to 6 carbon atoms;

 R_3 and R_4 are independently hydrogen or lower alkyl having 1 to 6 carbon atoms and each R_3 and R_4 is independently selected in each -0-CHR₃-CHR₄- unit;

n is an integer from 0 to 100:

and when n is 0 to 10, then R_5 is a polyalkyl group having an average molecular weight in the range of about 450 to 5,000;

and when n is 5 to 100, then R_5 is hydrogen, alkyl having 1 to 100 carbon atoms, phenyl, aralkyl having 7 to 100 carbon atoms, alkaryl having 7 to 100 carbon atoms, or an acyl group having the formula:

$$-C-R_6 \qquad \text{or} \qquad -C-(CH_2)_y \longrightarrow R_7$$

wherein R_6 is alkyl having 1 to 30 carbon atoms, phenyl, aralkyl having 7 to 36 carbon atoms or alkaryl having 7 to 36 carbon atoms;

R₇ and R₈ are independently hydrogen, hydroxy, lower alkyl having 1 to 6 carbon atoms, or lower alkoxy having 1 to 6 carbon atoms;

 A_2 is selected from the group consisting of SR^{IX} , SOR^X , SO_2R^{XI} , wherein R^{IX} , R^X and R^{XI} are independently lower alkyl of 1 to 6 carbon atoms; SO_3H ; $SO_2NR^{XII}R^{XIII}$, wherein R^{XII} and R^{XIII} are independently hydrogen or lower alkyl of 1 to 6 carbon atoms; CN; CO_2R^{XIV} , wherein R^{XIV} is hydrogen or lower alkyl of 1 to 6 carbon atoms; and $C(O)NR^{XV}R^{XVI}$, wherein R^{XV} and R^{XVI} are independently hydrogen or lower alkyl of 1 to 6 carbon atoms;

and x and y are independently integers from 0 to 10;

with the proviso that when n and x are both 0, then A_1 may not be CO_2R^{VI} or $C(0)NR^{VII}R^{VIII}$.

The fuel concentrate according to Claim 45 wherein R_1 is hydrogen, hydroxy or lower alkyl having 1 to 4 carbon atoms.

01	47.	The fuel	concentrate	according	tọ	Claim	46	wherein	R
02		is hydro	gen or hydro	KY•	•	•	•		٠.

04 48. The fuel concentrate according to Claim 47 wherein R_1 05 is hydrogen.

06

07 The fuel concentrate according to Claim 45 wherein R, 80 is hydrogen.

09

10 The fuel concentrate according to Claim 45 wherein x is 11 an integer from 0 to 2.

12

13 The fuel concentrate according to Claim 50 wherein x is 14 0.

15

16 The fuel concentrate according to Claim 46 wherein n is 17 an integer from 0 to 10.

18

19 The fuel concentrate according to Claim 52 wherein n is 20 an integer from 0 to 5. 21

22 The fuel concentrate according to Claim 53 wherein n is 23 0.

24

· 25 The fuel concentrate according to Claim 52 wherein R1 26 and R_2 are both hydrogen and x and n are both 0. 27

28

The fuel concentrate according to Claim 52 wherein R_5 29 is a polyalkyl group derived from polypropylene, 30 polybutene, or polyalphaolefin oligomers of 1-octene or 31 1-decene. 32

33

57. The fuel concentrate according to Claim 56 wherein R₅

03

58. The fuel concentrate according to Claim 45 wherein n is an integer from 5 to 100.

05 06

of 59. The fuel concentrate according to Claim 58 wherein n is an integer from 8 to 50.

09

10 60. The fuel concentrate according to Claim 59 wherein n is an integer from 10 to 30.

13

14.

61. The fuel concentrate according to Claim 58 wherein R₅ is hydrogen, alkyl having 1 to 30 carbon atoms or alkylphenyl having an alkyl group containing 1 to 30 carbon atoms.

16 17

62. The fuel concentrate according to Claim 45 wherein one of R_3 and R_4 is lower alkyl having 1 to 3 carbon atoms and the other is hydrogen.

21 22

63. The fuel concentrate according to Claim 62 wherein one of R_3 and R_4 is methyl or ethyl and the other is hydrogen.

25

23

64. The fuel concentrate according to Claim 58 wherein R_1 and R_2 are hydrogen, R_5 is alkylphenyl having an alkyl group containing 4 to 12 carbon atoms, and x is 0.

31 65. The fuel concentrate according to Claim 45 wherein A_1 is selected from the group consisting of SR^I , SO_2R^{III} , CN, CO_2R^{VI} and $C(O)NR^{VII}R^{VIII}$.

-60-

01 66. The fuel concentrate according to Claim 65 wherein A_1 02 is CO_2R^{VI} or $C(O)NR^{VII}R^{VIII}$.
